                                                                                                                                                                                                        The present sequence encodes a human BS322 polypeptide. BS322 is a breast tissue marker. The BS322 polynuclectides and polypeptides are used to detect and diagnose breast disease, e.g. breast cancer. The BS322 polynuclectides are useful as a source of probes and primers, and the BS322 polypeptides are useful as antigens

Also included are expression vectors expressing the proteins, transformed cells and antibodies raised against the proteins or an antigen presenting cell expressing the protein. The proteins and nucleic acids may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate breast tumour protein expression, i.e. breast tumours and

                                                                                                                                                                                                                                                                                    40
                                                                                                                                                                                                                                                                                                                                9
                                                                                                                                                                                                                                          20
                        The present sequence represents the full length cDNA sequence encoding BS322 polypeptide. BS322 is a breast tissue marker. The BS322 polymorlectides and polymorpatides are used to detect and diagnose breast disease, e.g. breast cancer. The BS322 polymuclectides are useful as a source of probes and primers, and the BS322 polypeptides are useful as

Also included are expression vectors expressing the proteins, transformed cells and antibodies raised against the proteins or an antigen presenting cells and antibodies raised against the proteins or an antigen presenting cells and antibodies raised against the proteins or an antigen presenting in the prevention, diagnosis and treatment of diseases associated with inappropriate breast tumour protein expression, i.e. breast tumours and complements may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids and their complements may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and therefore which patients may be in need of restorative therapy. The proteins, nucleic acids and antibodies may be used to down requiste expression and activity. The antibodies may also be used to down requist expression and activity. The antibodies may also be used as diagnostic agents for detecting the presence of the proteins in samples (e.g. by enzyme linked immunosorbant assay (ELISA)) and in other immunocorpant assay (ELISA) and in other immunocorpant and encodes a breast tumour protein of the
including immunogenic fragments of the proteins
   encode them,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1395
                                                                                                                                                                                                                The invention relates to an isolated breast tumour polynuclectide and the polypeptide it encodes. The polynuclectide and polypeptide are useful for detecting the presence of breast cancer in a patient, and in pharmaceutical compositions for treating breast cancer. The sequences are useful for stimulating an immune response in a patient and can therefore be used in production of vaccines. The sequences are also useful for detecting the presence of a cancer in a patient, by obtaining a biological sample from the patient, contacting the biological sample with a composition of the invention and detecting the amount of polynucleotide that hybridizes to the sample. This sequence represents a human breast tumour polynucleotide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1155

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  80
                                                                                                         The invention comprises a method of stimulating and/or expanding T cells specific for a tumour protein. The invention further comprises human nucleic acids and proteins that are associated with tumours (e.g. breast cancer). The method and sequences of the invention are useful for stimulating and/or expanding T cells specific for a tumour protein, detecting the presence of cancer, stimulating an immune response in a patient and treating breast cancer. The present DNA sequence represents a human tumour-related DNA sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                        40

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              80
                                                                                                                                     The invention relates to an isolated breast cancer-associated polypeptide. The polypeptide may be used for the diagnosis and treatment of breast cancers. The methods are useful for detecting the presence of cancer in a patient and treating a cancer in a patient. The present sequence represents DNA encoding a human breast cancer-associated polypeptide fusion protein.

DNA microarray analysis; polymerase chain reaction;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to identifying tissue-specific polynucleotides (F that involves performing a genetic subtraction to identify pool of (P) from tissue of interest (TI), performing DNA microarray analysis to identify first subset of polynucleotides (SPI) at least 2-fold over expressed in TI, and performing quantitative polymerase chain reaction (PCR) analysis on SPI to identify second subset of (P). The method is useful for determining the presence or absence of a cancer cell in a patient, monitoring the progression of cancer in a patient using a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Identifying tissue (tumor)-specific polynucleotides overexpressed in tissue of interest as compared to control tissue, for detecting cancer cells in patient, comprises DNA microarray analysis or quantitative

The present invention provides the coding sequences and some protein sequences of proteins associated with breast cancer in humans. These sequences can be used in the diagnosis and treatment of cancers, particularly breast tumours

 polypeptide it encodes. The polynucleotide and polypeptide are useful for detecting the presence of breast cancer in a patient, and in pharmacutical compositions for treating breast cancer. The sequences are useful for stimulating an immune response in a patient and can therefore be used in production of vaccines. The sequences are also useful for detecting the presence of a cancer in a patient, by obtaining a biological sample from the patient, contacting the biological sample a composition of the invention and detecting the amount of polynucleotide that hybridizes to the sample. This sequence represents a human breast
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       100

```

The invention relates to an isolated breast cancer-associated polypeptide. The polypeptide may be used for the diagnosis and treatment of breast cancers. The methods are useful for detecting the presence of An isolated oncogenic polypeptide useful for preventing, diagnosing and treating breast cancer. The invention relates to an isolated polypeptide comprising at least an immunogenic portion of a breast tumour protein. The polymucleotide, its polypeptide, its antibody, a pharmaceutical composition comprising the fusion protein or the polymucleotide encoding it, a vaccine comprising the fusion protein or the polymucleotide encoding it, an isolated T cell population comprising T cells specific for a breast tumour protein, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel isolated polypeptide comprising immunogenic portion of breast tun protein or its variant, useful for formulating vaccines for inhibiting cancer development in a patient.

method for removing tumour cells from a biological sample is useful for inhibiting the development of a cancer in a patient. The polypeptide is useful for stimulating and/or expanding T cells specific for a breast tumour protein. Stimulating and/or expanding T cells specific for a breast tumour protein is useful for inhibiting the development of a breast tumour protein is useful for inhibiting the development of a cancer in a patient. The method additionally involves the step of cloning at least one proliferated cell and then administering the cloned T cells to the patient. The present sequence represents a cDNA associated with

                                                                                                                                                                                                                                 360
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention comprises a method of stimulating and/or expanding T cells specific for a tumour protein. The invention further comprises human nucleic acids and proteins that are associated with tumours (e.g. breast cancer). The method and sequences of the invention are useful for stimulating and/or expanding T cells specific for a tumour protein,
